

ORGANIC SEARCH READINESS REPORT

Full SEO Audit

Technical foundation, search visibility, content strategy, performance and a prioritized 30-day roadmap.

AUDITED WEBSITE

growthliftstudio.in

Executive Summary

Growth Lift Studio has a promising content foundation: a clear commercial offer, niche-specific articles, a valid robots file, a sitemap, HTTPS, solid desktop performance, and generally clean rendered page structure.

The largest opportunity is technical. Every tested URL returns the same JavaScript application shell before rendering, including a deliberately fake URL. Search engines are being asked to do extra work before they can understand the site.

3**critical issues**

Fix these before scaling content production.

3**P0 ISSUES****6****P1 ISSUES****5****P2 ISSUES****12****STRENGTHS**

Main finding: unknown URLs return `200 OK`, render the homepage, and self-canonicalize after JavaScript loads. This creates soft-404 and duplicate-indexation risk.

The immediate sequence

1**P0****Add a real 404 response**

Unknown routes must not resolve as indexable homepage copies.

2**P0****Serve route-specific HTML**

Use SSR, static generation, or prerendering for indexable routes.

3**P0****Fix the social-share image**

The configured Open Graph image currently returns HTML.

4**P1****Complete sitemap coverage**

Add both published articles and automate future inclusion.

5**P1****Align schema with visible content**

Remove the sitewide FAQ markup and add page-accurate schema.

6**P1****Build topical depth**

Clarify positioning, strengthen internal links, and add proof-led vertical pages.

Contents & Scope

Contents

- UX, metadata and trust 13
- What is already working 15
- 30-day roadmap 16
- Measurement baseline 18

AUDIT BOUNDARY

Live public-site review

No Google Search Console, GA4, CMS, server logs, or commercial backlink database access was provided. Public search samples are directional, not a definitive indexation diagnosis.

Rendered routes crawled

/ , /services , /results , /about	/testimonials , /faq , /blog , /contact
/privacy-policy , /terms-conditions	Both published article routes and a deliberately fake route

Direct server and performance checks

/robots.txt , /sitemap.xml , /sitemap_index.xml	HTTP-to-HTTPS and www -to-apex redirects
Raw HTML before JavaScript rendering	JavaScript, CSS, icon, article and Open Graph assets
Mobile responsive homepage inspection	Google PageSpeed Insights mobile and desktop reports

How to use this report: finish the P0 items first. They improve the reliability of every later content, internal-linking and authority investment.

P0.1 - Unknown URLs return 200

CRITICAL

Unknown paths render as homepage copies

The deliberately fake route `/nonexistent-seo-audit-check` returned `200 OK`. Its raw response was the same `8,942`-byte HTML shell as the homepage.

After JavaScript rendered, the fake route displayed homepage content and set its own canonical:

```
title: Growth Lift Studio | Lead Generation for Home Improvement Contractors
canonical: https://growthliftstudio.in/nonexistent-seo-audit-check
H1: Your calendar shouldn't have empty slots.
```

`/sitemap_index.xml` also returns `200 OK` HTML instead of a sitemap index or a `404`.

WHY IT MATTERS

Soft-404 and duplication risk

Search engines can interpret unknown paths as soft 404s. Arbitrary URLs can also look like valid, self-canonicalized duplicates of the homepage.

EXPECTED BEHAVIOR

Return a true 404

Unknown routes should return an actual `404` status with a useful branded error page and no self-referencing canonical.

Implementation checklist

- Add a catch-all route that returns HTTP `404`.
- Render a branded 404 page with links to homepage, services, case studies and contact.
- Do not add canonical tags to unknown routes.
- Return `404` for `/sitemap_index.xml` unless a real sitemap index is needed.

Reference: Google Search Central, HTTP and network errors - soft 404 errors.

P0.2 - SEO HTML depends on JavaScript

CRITICAL

Every HTML route initially serves the same shell

The initial raw HTML response is generic across the homepage, commercial pages, blog, legal pages and unknown URLs:

```
<title>Qualified Booked Appointments | Growth Lift Studio</title>
<meta name="description" content="Performance-based lead generation...">
<div id="root"></div>
```

The raw response contains no canonical tag. JavaScript later changes titles, descriptions, canonicals, headings, body content and page-specific schema in the browser.

Example: /services

SIGNAL	RAW SERVER HTML	AFTER JAVASCRIPT RENDERING
Title	Generic homepage title	Our Trade Pipeline Services Growth Lift Studio
Canonical	Missing	https://growthliftstudio.in/services
H1	Missing	What we handle-so your calendar stays consistent.
Body content	Empty root element	Route-specific service copy

WHY IT MATTERS

Google can render JavaScript, but reliable discovery and indexing are faster when each URL serves its own HTML. Non-rendering crawlers and social scrapers receive the generic shell.

RECOMMENDED FIX

Use server-side rendering, static generation or prerendered HTML. Keep client-side hydration for interactive behavior only.

Each indexable route should serve: unique title, meta description, canonical, Open Graph tags, Twitter tags, headings, primary body content and relevant schema in the initial response.

Reference: Google Search Central, JavaScript SEO basics.

P0.3 - Social preview image is broken

CRITICAL

The configured Open Graph image is not an image

The page metadata points social platforms to:

```
https://growthliftstudio.in/assets/og-image.png
```

The URL returns:

Status	200 OK
Content type	text/html; charset=utf-8
Body	The single-page-app HTML shell

BUSINESS IMPACT

Shared links lose visual trust

LinkedIn, Facebook, WhatsApp, X and other social surfaces may show a blank or incomplete preview. That weakens click-through and first-impression quality.

FIX SPECIFICATION

Publish a real share card

Use a real **1200 x 630** PNG, JPEG or WebP image and confirm the response advertises an image MIME type.

Next iteration: create route-specific social images for the homepage, case studies and both published articles. Use a consistent visual system with the article title and an agency brand mark.

Recommended validation

- Open the asset URL directly and verify that the image renders.
- Check the content type is `image/png`, `image/jpeg` or `image/webp`.
- Run LinkedIn Post Inspector and Facebook Sharing Debugger after deployment.

P1 - Discovery and sitemap coverage

HIGH IMPACT

Both published articles are missing from the sitemap

The blog index links to two substantive articles. Both have rendered canonicals and useful depth, but neither appears in `/sitemap.xml`.

ARTICLE	APPROX. MAIN-CONTENT WORDS	IN SITEMAP?
Facebook Ads for Bathroom Remodeling Contractors	1,233	No
Google Ads for Kitchen Remodeling Contractors	1,302	No

HIGH IMPACT

Public search samples did not surface site pages

Public result samples for `site:growthliftstudio.in`, branded searches and article-title queries did not surface site pages during the audit.

Interpretation: search operators are approximate. This is not a definitive indexation test. Google Search Console URL Inspection is the authoritative next check.

Actions

1. Add both article URLs with accurate `<lastmod>` values.
2. Generate the sitemap from the content source so future posts cannot be missed.
3. Verify the domain in Google Search Console and Bing Webmaster Tools.
4. Submit `https://growthliftstudio.in/sitemap.xml`.
5. Inspect homepage, services, blog index and both articles after P0 fixes ship.
6. Review the Page Indexing report weekly for the first 60 days.

Reference: Google Search Central, Build and submit a sitemap.

P1 - Schema must match visible content

HIGH IMPACT

FAQ schema is injected sitewide

The initial HTML includes the same `FAQPage` block with ten questions on every tested page: homepage, services, articles, legal pages and more.

The visible `/faq` page offers a different set of eight questions.

VISIBLE FAQ EXAMPLE

"I've tried Facebook Ads before and wasted money. Why would this be different?"

"What's the contract commitment?"

INJECTED JSON-LD EXAMPLE

"How much does Growth Lift Studio charge for lead generation?"

"Does Growth Lift Studio create the ad creatives?"

Why it matters: structured data should describe the page where it appears and match the content visitors can see. Sitewide FAQ markup adds noise and avoidable policy-quality risk.

Recommended schema model

PAGE TYPE	RECOMMENDED SCHEMA
Homepage	<code>WebSite</code> , business or organization schema
Services and supporting pages	<code>BreadcrumbList</code> and accurate <code>Service</code> markup where useful
FAQ page	<code>FAQPage</code> only when markup matches visible questions and answers
Blog articles	<code>BlogPosting</code> , <code>BreadcrumbList</code> , author and publisher details
Legal pages	Minimal page-specific schema only if relevant

Reference: Google Search Central, FAQ structured data.

P1 - Clarify topical positioning

HIGH IMPACT

The site describes two different target markets

Visible pages describe a broad home-service offer. The global schema describes a narrower specialist agency.

VISIBLE CONTENT

Broad home-service positioning

- Remodeling
- Roofing
- HVAC
- Plumbing
- Landscaping

GLOBAL SCHEMA

Narrow specialist positioning

- Bathroom remodeling
- Kitchen remodeling
- Window replacement

Why it matters: search engines and prospects need a consistent answer to a simple question: who is this agency for? Mixed signals weaken relevance and conversion clarity.

Choose one model

OPTION A

Narrow specialist

Own remodeling and selected home-improvement trades.
Build deeper authority around fewer, higher-confidence verticals.

OPTION B

Broader agency

Serve home-service businesses broadly, supported by real proof and genuinely differentiated vertical pages.

Whichever model is chosen, align navigation, titles, schema, case studies, articles and sales copy. Avoid thin doorway pages. Each vertical page should include distinct expertise, economics, objections, proof, FAQs and next steps.

P1 - Strengthen commercial depth

HIGH IMPACT

Commercial pages are shallow

ROUTE	APPROX. WORDS
/services	162
/results	248
/about	264
/testimonials	133
/blog	118

HIGH IMPACT

Articles lack contextual internal links

Each article contains only two main-content links. Both say [Back to Blog](#).

There are no crawlable contextual links to services, case studies, contact, or the other related article.

Recommended architecture

TYPE	EXAMPLE ROUTE	PURPOSE
Service	/services/facebook-ads-home-improvement-contractors	Offer, process, proof, FAQs and CTA
Service	/services/google-ads-remodeling-contractors	High-intent demand capture offer
Industry	/industries/bathroom-remodeling-lead-generation	Vertical expertise, economics, objections and proof
Industry	/industries/kitchen-remodeling-lead-generation	Vertical-specific use case and links to related guide

Internal-linking pattern: articles should link naturally to the most relevant service page, a proof point or case study, a related guide and a crawlable contact CTA. Services pages should link back to supporting articles.

Improve case studies with anonymized-but-verifiable detail where confidentiality applies: date range, spend, lead volume, booked jobs, sales cycle, constraints and screenshots.

Mobile performance dashboard

Mobile Lighthouse

Report captured June 2, 2026

Desktop Lighthouse

Strong desktop baseline

No Chrome UX Report field data is available yet. The scores below are Lighthouse lab diagnostics, not real-user Core Web Vitals.

Mobile metrics

Lighthouse opportunities

HEALTHY SIGNAL

Layout stability is strong

Mobile CLS is **0.004**. Visual shifting is not the primary performance concern.

PRIMARY CONCERN

Delivery and render cost

Focus on route-level JavaScript, image formats, caching and deferred loading.

Asset delivery recommendations

Measured asset observations

ASSET	UNCOMPRESSED SIZE	OBSERVATION
Main JavaScript bundle	576,526 bytes	Served with Brotli, but still a large route-global bundle
Main CSS bundle	61,963 bytes	Fingerprint exists, but cache policy is conservative
Kitchen-remodel article PNG	766,742 bytes	Strong candidate for WebP or AVIF
Results screenshot PNG	160,949 bytes	Optimize and lazy-load below fold
Results ad-set PNG	68,754 bytes	Optimize if visual quality remains acceptable

MEDIUM IMPACT

Fingerprint assets use weak browser caching

The main fingerprinted JavaScript and CSS files return:

```
Cache-Control: public, max-age=0, must-revalidate
```

Versioned static assets should generally use a long immutable policy:

```
Cache-Control: public, max-age=31536000, immutable
```

CODE

- Code-split route content.
- Defer non-critical JavaScript.
- Retest after SSR or prerendering changes.

IMAGES AND DELIVERY

- Convert large PNGs to WebP or AVIF.
- Provide responsive image sizes.
- Lazy-load below-the-fold article images.

Keep HTML short-lived. Apply immutable caching only to fingerprinted assets. HTML should continue using a short revalidation policy so deploys propagate quickly.

P2 - Metadata, redirects and copy

MEDIUM IMPACT

Several route-level details need cleanup

LOCATION	OBSERVED ISSUE	RECOMMENDED ACTION
/about	Rendered title says B2B B2B Contractor Lead Gen	Remove the repeated term
Legal pages	Generic title and no rendered canonical	Add unique titles and canonicals
/blog	H1 renders as Paid Ads. Real Results.No Fluff.	Add the missing space
Homepage	Copy says Brand we closely work with	Correct the visible grammar
All raw routes	Social metadata stays generic before rendering	Serve route-specific social metadata

MEDIUM IMPACT

Canonical hostname redirect is temporary

REDIRECT	OBSERVED STATUS	RECOMMENDATION
http://growthliftstudio.in/ to HTTPS	308 Permanent Redirect	Keep
https://www.growthliftstudio.in/ to apex	307 Temporary Redirect	Use 301 or 308

Good hygiene: HTTPS is enabled, HSTS is present, and the HTTP-to-HTTPS redirect is already permanent.

P2 - Make proof more concrete

EXISTING STRENGTHS

- Founder name is visible.
- Phone and email are visible on `/contact`.
- A named video testimonial appears on `/testimonials`.
- Results include markets, timeframes, spend estimates and outcomes.

RECOMMENDED UPGRADES

- Turn visible email and phone text into `mailto:` and `tel:` links.
- Add a fuller founder profile and clearer business identity section.
- Link experience claims to verifiable profiles or work.
- Align business schema with the actual offer and contact details.

Proof-led case-study template

Use anonymized-but-verifiable detail when confidentiality applies: client type, market, date range, starting constraint, spend, lead volume, booked appointments, sales-cycle notes, screenshots, method and a clear result statement.

Recommended case-study structure

SECTION	WHAT TO INCLUDE
Context	Trade, city or market type, team size and commercial goal
Challenge	Pipeline gaps, lead-quality issue, seasonality or conversion problem
Intervention	Campaign type, booking flow, follow-up and optimization approach
Evidence	Screenshots, spend range, lead volume, booking count and timeframe
Outcome	What changed operationally and financially
Next step	Crawable link to book an audit or view the relevant service

What is already working

The technical fixes matter, but the current site is not starting from zero. These strengths are worth preserving through the rebuild.

CRAWL FOUNDATION

- HTTPS is enabled with HSTS.
- HTTP redirects to HTTPS permanently.
- `robots.txt` allows crawling.
- The robots file references the sitemap.
- The primary sitemap is valid XML.

RENDERED ON-PAGE SIGNALS

- Core pages generally have one clear H1.
- Core pages generally render unique titles and descriptions.
- Core pages generally render self-referencing canonicals.
- Reviewed article images include descriptive alt text.

CONTENT ASSETS

- Two useful niche articles are already published.
- Articles are materially deeper than commercial pages.
- Articles render `BlogPosting` and breadcrumb schema.
- The offer is clear and outcome oriented.

EXPERIENCE

- Desktop Lighthouse performance is strong.
- Mobile layout stability is strong.
- Homepage mobile inspection found no horizontal overflow.
- Trust signals and case-study foundations exist.

Strategic read:

The website has the beginnings of a credible acquisition asset. The next gains should come from making the existing site reliably indexable, then building focused authority around the agency's most defensible niches.

Recommended 30-day roadmap

Work in sequence. The technical foundation comes first because it improves the return on every content and authority investment after it.

DAYS 1-3

Technical unblock

1. Add route-level `404` handling.
2. Implement SSR, static generation or prerendering.
3. Fix the Open Graph image.
4. Add article URLs to the sitemap.
5. Use a permanent `www` redirect.

DAYS 4-7

Search quality

1. Remove global FAQ schema.
2. Add page-accurate schema.
3. Serve unique metadata and canonicals.
4. Fix legal metadata and copy.
5. Submit sitemap and inspect URLs.

DAYS 8-14

Commercial relevance

1. Choose the positioning model.
2. Build two to four useful vertical pages.
3. Add contextual internal links.
4. Expand proof-led case studies.

DAYS 15-30

Performance and measurement

1. Optimize article images.
2. Split JavaScript where practical.
3. Add immutable caching.
4. Retest mobile Lighthouse.
5. Monitor Search Console reports.

Decision gate: do not scale article production until the P0 technical issues are deployed and validated. More content will not solve unreliable route responses.

Prioritized implementation backlog

PRIORITY	TASK	EXPECTED IMPACT	EFFORT
P0	Return true 404 responses for unknown routes	Prevents soft-404 and duplicate-route risk	Low-Med
P0	Serve page-specific initial HTML	Improves crawl reliability and indexing clarity	Med-High
P0	Publish a valid Open Graph image	Restores social-share trust and click-through quality	Low
P1	Add articles to generated sitemap	Improves content discovery	Low
P1	Remove global FAQ schema	Improves structured-data accuracy	Low
P1	Align niche positioning	Strengthens topical relevance and conversion clarity	Med
P1	Add contextual internal links	Passes relevance and users toward commercial pages	Low
P1	Build proof-led offering and vertical pages	Creates ranking entry points for non-brand intent	Med-High
P2	Fix metadata, copy and legal canonicals	Improves polish and route clarity	Low
P2	Use permanent www redirect	Clarifies canonical hostname	Low
P2	Optimize images and cache hashed assets	Improves repeat-load and mobile experience	Low-Med
P2	Expand case-study proof and trust links	Improves conversion confidence	Med

Recommended ownership split: development handles routing, prerendering, redirects, sitemap generation and asset caching. Content handles positioning, page depth, internal linking and proof. Marketing operations handles Search Console submission and measurement.

Weekly SEO baseline

Once the technical fixes are live, track this baseline weekly. The goal is to connect indexation health to commercial visibility and qualified leads.

INDEXATION HEALTH

- Indexed pages
- Excluded pages
- Soft-404 reports
- Sitemap discovered vs indexed URLs
- URL Inspection outcomes for priority pages

SEARCH DEMAND

- Non-brand impressions and clicks
- Query groups by service and vertical
- Article impressions and click-through rate
- Landing-page positions over time

CONVERSION

- Organic landing-page leads
- Pipeline audit bookings
- Article-to-service click-through
- Organic lead quality and close rate

EXPERIENCE

- Mobile LCP after deployment
- Core Web Vitals when field data appears
- Mobile Lighthouse trend
- Image weight and JavaScript bundle trend

60

days of close monitoring

Review Page Indexing weekly after deployment. Fix exclusions before publishing at scale.

Recommended reporting rhythm

FREQUENCY	FOCUS
Weekly	Indexation, sitemap coverage, top queries, technical exclusions
Monthly	Content performance, service-page conversion and new opportunities
Quarterly	Topic architecture, authority growth and case-study expansion

Source links
